Series on Advances in Mathematics for Applied Sciences: Volume 87

MATHEMATICAL METHODS FOR THE NATURAL AND ENGINEERING SCIENCES

2nd Edition

By **Ronald E Mickens** (*Clark Atlanta University, USA*)

Description:

This second edition provides a broad range of methods and concepts required for the analysis and solution of equations which arise in the modeling of phenomena in the natural, engineering, and applied mathematical sciences. It may be used productively by both undergraduate and graduate students, as well as others who wish to learn, understand, and apply these techniques. Detailed discussions are also given for several topics that are not usually included in standard textbooks at this level of presentation: qualitative methods for differential equations, dimensionalization and scaling, elements of asymptotics, difference equations and several perturbation procedures. Further, this second edition includes several new topics covering functional equations, the Lambert–W function, nonstandard sets of periodic functions, and the method of dominant balance. Each chapter contains a large number of worked examples and provides references to the appropriate books and literature.

Pub Date: Mar 2017

Binding: Hardcover

ISBN: 978-981-3202-70-2

Price: £112

Page Extent: 650pp

Type: Textbook

Main Subject: Mathematics

Sub-subjects: Mathematical Modeling | Mathematical Physics | General Applied Mathematics

BIC: PBWH

BISAC: MAT003000; SCI043000

Keywords: Mathematical Methods; Nonlinear Oscillations; Perturbation Methods; Asymptotics; Difference Equations; Special Functions; Functional Equations; Periodic Equations

Imprint: World Scientific Publishing Company

Readership: Undergraduate and graduate students, and researchers studying or using mathematical techniques and methods.

World Scientific
Connecting Great Minds

Contents:

- Trigonometric Relations and Fourier Analysis, Gamma, Beta, Zeta and Other Named Functions
- Qualitative Methods for Ordinary Differential Equations
- Difference Equations
- Sturm-Liouville Problems
- Special Functions and Their Properties
- Perturbation Methods for Oscillatory Systems
- Approximations of Integrals and Sums
- Some Important Nonlinear Partial Differential Equations
- Generalized Periodic Functions
- Functional Equations
- Miscellaneous Topics

World Scientific
Connecting Great Minds
